Subject: Policy Meeting Item 3 - New Lighting ordinance

I had raised my hand to speak on item 3 at today's Policy Meeting, but apparently missed the Mayor's attention. My comment was to be focused on how to be able to objectively enforce the lighting impact on neighbors. Is it possible to measure lumens of light at a specific distance from the source to determine if TOO bright? This is similar to the method of measuring noise from sources that could impact adjoining properties or neighborhoods?

Perhaps this could be included in the wording of the proposal that will come to this committee or the Council at their next meeting?

Take care and be safe, folks.
